## **Examples**

• How noisy can measurements be?

- How noisy can measurements be?
- How can a state estimation be robust despite all the errors?

K ロ ▶ K 리 ▶ K 코 ▶ K 코 ▶ │ 코 │ ◆ 9 Q (\*

RoboCup Small-Size League:

RoboCup Small-Size League:

 $\times$ ,y positions as measurement  $z_t.$ 

RoboCup Small-Size League:

- $\times$ ,y positions as measurement  $z_t.$
- . Only noisy measurements, we need the actual state (the model).

## RoboCup Small-Size League:

- $\times$ ,y positions as measurement  $z_t.$
- . Only noisy measurements, we need the actual state (the model).

#### RoboCup Small-Size League:

- $\times$ ,y positions as measurement  $z_t.$
- Only noisy measurements, we need the actual state (the model).

• Problem with two robots: wrong perceptions on other robot.

Obstacle avoidance using a laser range finder:

There can be several different errors in the measurements.

Obstacle avoidance using a laser range finder:

There can be several different errors in the measurements.

Obstacle avoidance using a laser range finder:

**•** There can be several different errors in the measurements.

Obstacle avoidance using a laser range finder:

- **•** There can be several different errors in the measurements.
- The general model for a beam based sensor is a mixture of several distributions.

Obstacle avoidance using a laser range finder:

- **O** There can be several different errors in the measurements.
- The general model for a beam based sensor is a mixture of several distributions.

• Knowledge about the behavior of a sensor (the sensor model) is very important for a robust state estimation.

3D ball-tracking with a camera:

3D ball-tracking with a camera:

Uncertainty, especially the distance of the ball to the camera.

3D ball-tracking with a camera:

- Uncertainty, especially the distance of the ball to the camera.
- State in world coordinates and should include the velocity.
- A single observation does not contain much information.

3D ball-tracking with a camera:

- Uncertainty, especially the distance of the ball to the camera.
- State in world coordinates and should include the velocity.
- A single observation does not contain much information.
- Consider only possible trajectories to reduce uncertainty.

3D ball-tracking with a camera:

- Uncertainty, especially the distance of the ball to the camera.
- State in world coordinates and should include the velocity.
- A single observation does not contain much information.
- Consider only possible trajectories to reduce uncertainty.

• Knowledge about the behavior of the ball and physics is useful (state transition model).

Self-localization in 1D with limited sensors:

### Self-localization in 1D with limited sensors:

Self-localization in 1D with limited sensors:

 $\bullet$  Door sensor  $\rightarrow$  ambiguous.

Even a sequence of measurements  $z_t$  is not enough to localize.

세미 시 세 ラ 시 모 시 시 된 시 그런 시

 $OQ$ 

#### Self-localization in 1D with limited sensors:

- $\bullet$  Door sensor  $\rightarrow$  ambiguous.
- Even a sequence of measurements  $z_t$  is not enough to localize.
- Another sensor needed: sensor to measure wheel rotations.

세미 시 세 ラ 시 모 시 시 된 시 그런 시  $OQ$

ı

\n- $$
p(x|y)p(y) = p(x, y) = p(y|x)p(x)
$$
\n- $p(x|y) = \frac{p(y|x)p(x)}{p(y)}$  const *y*  $p(y|x)p(x)$
\n

(ロ) (@) (혼) (혼) (혼) 2000

### Bayes rule

• 
$$
p(x|y)p(y) = p(x, y) = p(y|x)p(x)
$$
  
\n•  $p(x|y) = \frac{p(y|x)p(x)}{p(y)}$   $\stackrel{const \ y}{\propto} p(y|x)p(x)$ 

**• Bayes rule with background knowledge:**  $p(x|y, z) = \frac{p(y|x, z)p(x|z)}{p(y|z)}$ 

• What is  $P(open|z)?$ 

イロトイ部 トイヨト イヨト 一者  $\circledcirc \circledcirc \circledcirc$ 

#### Diagnostic vs. causal reasoning

- $\bullet$   $P(open|z)$  is diagnostic.
- $\circ$   $P(z|open)$  is causal.
- Often the causal knowledge is much easier to obtain (the sensor models).

イロト イ団 トイミト イミト ニヨー りんぐ

#### Diagnostic vs. causal reasoning

- $\circ$   $P(open|z)$  is diagnostic.
- $\circ$   $P(z|open)$  is causal.
- Often the causal knowledge is much easier to obtain (the sensor models).
- The bayes rule allows us to use causal knowledge to get  $P(open|z)$ :

 $\mathbf{E} = \mathbf{A} \oplus \mathbf{B} + \mathbf{A} \oplus \mathbf{B} + \mathbf{A} \oplus \mathbf{B} + \mathbf{A} \oplus \mathbf{B} + \mathbf{A} \oplus \mathbf{A}$ 

 $OQ$ 

$$
P(open|z) = \frac{P(z|open)P(open)}{P(z)}
$$

•  $P(z|open) = 0.6$   $P(z|\neg open) = 0.3$ 

• 
$$
P(open) = P(\neg open) = 0.5
$$

•  $P(z|open) = 0.6$   $P(z|\neg open) = 0.3$ 

• 
$$
P(open) = P(\neg open) = 0.5
$$

• 
$$
P(open|z) = \frac{P(z|open)P(open)}{P(z)}
$$

•  $P(z|open) = 0.6$   $P(z|\neg open) = 0.3$ 

• 
$$
P(open) = P(\neg open) = 0.5
$$

• 
$$
P(open|z) = \frac{P(z|open)P(open)}{P(z)}
$$

$$
P(\text{open}|z) = \frac{P(z|\text{open})P(\text{open})}{P(z|\text{open})P(\text{open}) + P(z|\neg \text{open})P(\neg \text{open})}
$$

•  $P(z|open) = 0.6$   $P(z|\neg open) = 0.3$ 

• 
$$
P(open) = P(\neg open) = 0.5
$$

• 
$$
P(open|z) = \frac{P(z|open)P(open)}{P(z)}
$$

• 
$$
P(open|z) = \frac{P(z|open)P(open)}{P(z|open)P(open) + P(z|\neg open)P(\neg open)}
$$

• 
$$
P(open|z) = \frac{0.6 * 0.5}{0.6 * 0.5 + 0.3 * 0.5} = \frac{2}{3} \approx 0.67
$$

K ロ ▶ K (日 ) K (王 ) K (王 ) X [王 ) 9 Q (연

### Bayes filter implementations

$$
Bel(x_t) = \eta p(z_t | x_t) \int p(x_t | u_{t-1}, x_{t-1}) Bel(x_{t-1})
$$

Some methods based on this equation:

- **•** Grid-based estimator
- **Kalman filter**
- **•** Particle filter

### Grid-based estimator

Can be useful e.g. for localizations using a grid-based environment map.

### Kalman filter

The belief is represented by multivariate normal distributions.

- many particles.
- few particles with higher weights.

# Importance sampling

 $\bullet$  Suppose we want to approximate a target density  $f$ .

### Importance sampling

 $\bullet$  Assume we can only draw samples from a density  $g$ .

### Importance sampling

 $\bullet$  The target density f can be approximated by attaching the weight  $w = f(x)/g(x)$  to each sample x.

#### Particle filter steps

- State transition/prediction: Sample new particles using  $p(x|u_{t-1}, x_{t-1}).$ 
	- In the context of localization: Move particles according to a motion model.
- Sensor update: Set particle weights using the likelihood  $p(z|x)$ .
- Resampling: Draw new samples from the old particles according to their weights.

# Resampling algorithm

### Summary

- Particle filters are an implementation of a recursive Bayesian filter.
- Belief is represented by a set of weighted samples.
- Samples can approximate arbitrary probability distributions.
- Works for non-Gaussian, nonlinear systems.
- Relatively easy to implement.
- Depending on the state space a large number of particles might be needed.

 $4 \Box + 4 \Box + 4 \Xi + 4 \Xi + 4 \Xi + 4 \Box$ 

Re-sampling step: new particles are drawn with a probability proportional to the likelihood of the observation.

# Problems

- Global localization problem (initial position).
- Robot kidnapping problem.

### Problems

- **•** Global localization problem (initial position).
- Robot kidnapping problem.
- Augmented Monte Carlo Localization:
	- Inject new particles when the average weight decreases.
	- New random particles or particles based on current perception.
