

# Non-context-free Languages

*How do we show something is not context free?*

## The Pumping Lemma

**Theorem.** (Pumping Lemma) Let  $L$  be context free. There exists a positive integer  $p$  with the following property.

For every  $w \in L$  of length at least  $p$ ,  $w$  is divided into five parts,  $u, v, x, y, z$ , such that

- $|vy| \geq 1$ ,
- $|vxy| \leq p$ , and
- for each  $i \geq 0$ ,  $uv^i xy^i z \in L$ .

## The Pumping Lemma

**Theorem. (Pumping Lemma)** Let  $L$  be context free. There exists a positive integer  $p$  with the following property.

For every  $w \in L$  of length at least  $p$ ,  $w$  is divided into five parts,  $u, v, x, y, z$ , such that

- $|vy| \geq 1$ ,
- $|vxy| \leq p$ , and
- for each  $i \geq 0$ ,  $uv^ixy^iz \in L$ .

The differences between this pumping lemma and the previous one.

- There are two components that are jointly inserted or deleted.
- The part  $vxy$  may not be at the beginning of  $w$ .

## Proving the Pumping Lemma

Let  $L = L(G)$  for some CNF grammar  $G = (V, \Sigma, R, S)$ .

If  $L$  is finite (i.e., has only a finite number of members), then there is a length  $k$  such that each member of  $L$  has length less than  $k$ . We have only to choose  $p$  to be  $k$ .

So we will assume  $L$  is infinite.

## Proving the Pumping Lemma

Set  $m = \|V\|$  and  $p = 2^m$ .

Let  $w$  be an arbitrary member of  $L$  having length at least  $p$ . Let  $T$  be a derivation tree for  $w$ .

Since  $G$  is a CNF grammar, for each subtree of  $T$ , the following properties hold:

- Each non-leaf node of  $R$  is a variable.
- Each leaf of  $R$  is a terminal.
- Each leaf of  $R$  is a unique child of its parent.
- Except for the leaves and their parents each node of  $R$  has exactly two children.
- The concatenation of the leaves of  $R$  is a substring of  $w$ .

## A Useful Property

An **ancestor–descendant pair with identical label (ADPIL, for short)** in a production tree  $R$  is a node pair  $(r, s)$  such that

- $r$  is an ancestor of  $s$  and
- the label of  $r$  is identical to the label of  $s$  (and thus, the label is a nonterminal).

## Proof (cont'd)

**Claim.** If  $R$  has more than  $p/2 = 2^{m-1}$  leaves, then  $R$  contains an ADPIL.

## Proof (cont'd)

**Claim.** If  $R$  has more than  $p/2 = 2^{m-1}$  leaves, then  $R$  contains an ADPIL.

### Proof

Suppose  $R$  is a subtree of  $T$  with at least  $2^{m-1} + 1$  leaves.

Let  $R'$  be the tree constructed from  $R$  by removing all the leaves.

Since the terminals appear only at the leaves, the claim is equivalent to saying that  $R'$  has an ADPIL.

The claim is proved by showing, by contradiction, that there is a root-to-leaf path in  $R'$  with at least  $m + 1$  nodes,

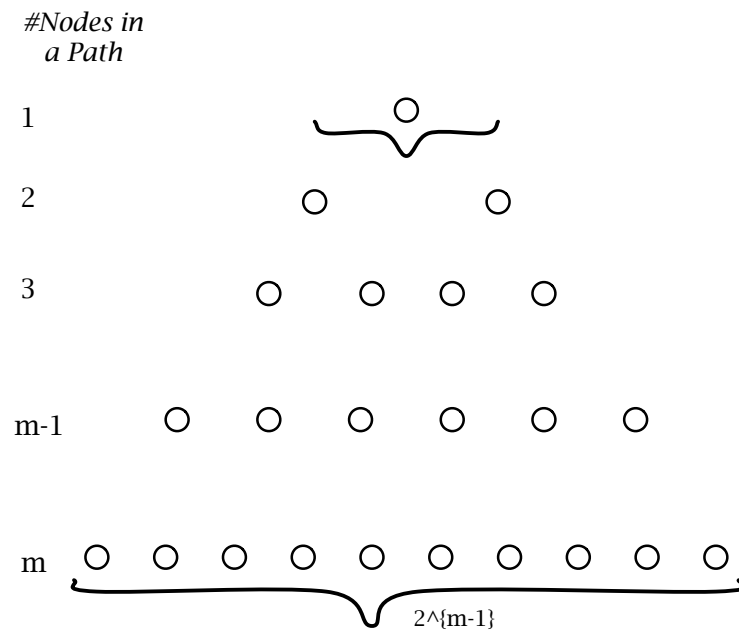

## Proof (cont'd)

Assume, by way of contradiction, that every root-to-leaf path of  $R'$  has at most  $m$  nodes,

## Proof (cont'd)

Assume, by way of contradiction, that every root-to-leaf path of  $R'$  has at most  $m$  nodes,

Then the number of branches in any such path is at most  $m - 1$ .  
Since  $R'$  is a binary tree,  $R'$  has at most  $2^{m-1}$  leaves.

## Proof (cont'd)

However, the number of leaves of  $R'$  is greater than  $2^{m-1}$ . Thus, there is a root-to-leaf path, say  $\pi$ , in  $R'$  having length at least  $m + 1$ .

Then, by the pigeonhole principle, an ADPIL appears on  $\pi$ .

## Proof of Claim

## Proof of Pumping Lemma (cont'd)

Using the following algorithm to find an ADPIL  $(r, s)$  farthest from the root of  $T$ .

1. Set  $u$  to the root of  $T$ .
2. Execute the following loop:
  - If the left child of  $u$  has an ADPIL, set  $u$  to the left child of  $u$ .
  - Otherwise, if the right child of  $u$  has an ADPIL, set  $u$  to the right child of  $u$ .
  - Otherwise, quit the loop.
3. Set  $r = u$  and  $s$  to the leftmost node with the same label as  $r$ .

## Proof of Pumping Lemma (cont'd)

Using the following algorithm to find an ADPIL  $(r, s)$  farthest from the root of  $T$ .

1. Set  $u$  to the root of  $T$ .
2. Execute the following loop:
  - If the left child of  $u$  has an ADPIL, set  $u$  to the left child of  $u$ .
  - Otherwise, if the right child of  $u$  has an ADPIL, set  $u$  to the right child of  $u$ .
  - Otherwise, quit the loop.
3. Set  $r = u$  and  $s$  to the leftmost node with the same label as  $r$ .

The children of  $r$  have no ADPILs. Thus, both children have at most  $2^{m-1}$  leaves and so  $r$  has at most  $p = 2^m$  leaves.

## Proof of Pumping Lemma (cont'd)

Let  $x$  be the string at the leaf-level of the subtree rooted at  $s$ . Similarly, let  $vxy$  be the one for  $r$ , where  $v$  and  $y$  are those to the left and to the right of  $x$ , respectively.

Let  $u$  be the string produced to the left of  $r$  and  $z$  to the right of  $s$ .

## Proof of Pumping Lemma (cont'd)

Let  $x$  be the string at the leaf-level of the subtree rooted at  $s$ . Similarly, let  $vxy$  be the one for  $r$ , where  $v$  and  $y$  are those to the left and to the right of  $x$ , respectively.

Let  $u$  be the string produced to the left of  $r$  and  $z$  to the right of  $s$ .

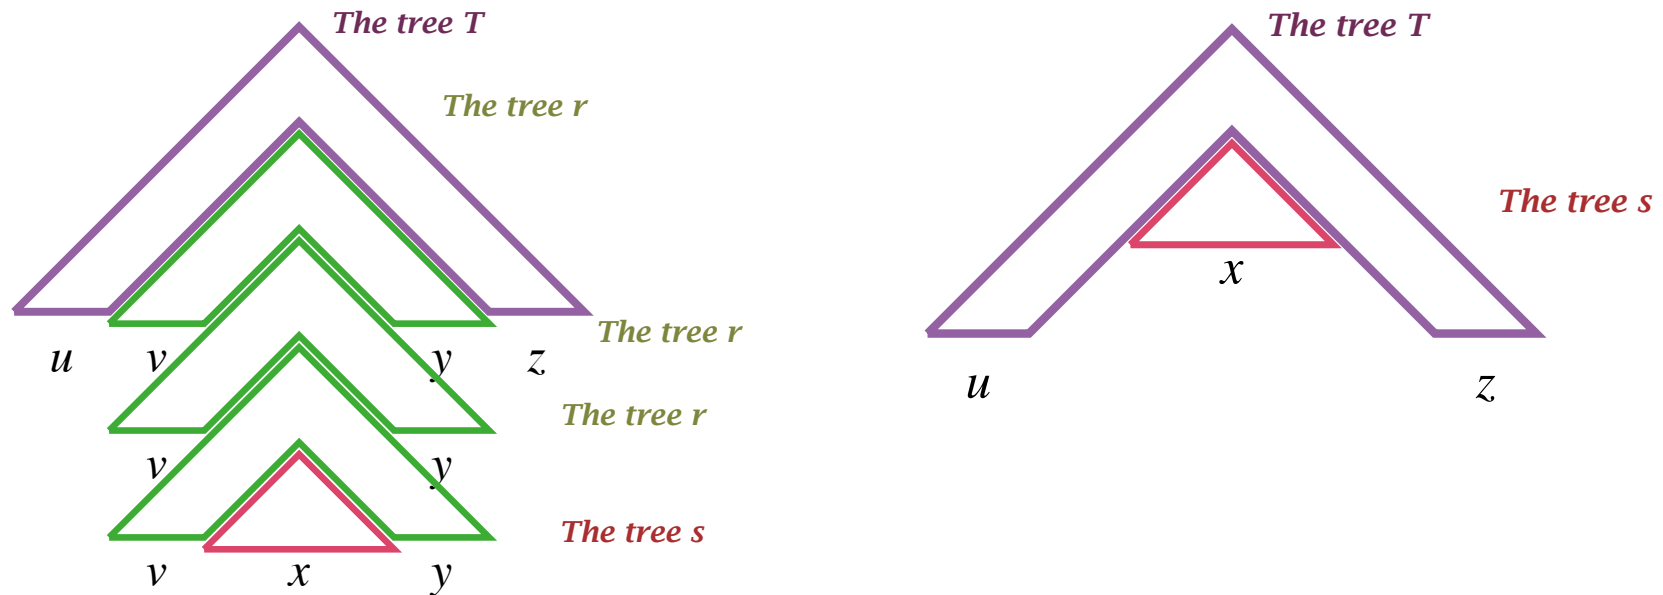

Then  $|vxy| \leq p$ .

Also, since  $s$  is a descendant of  $r$  and  $G$  has no  $\epsilon$ -production except for  $S \rightarrow \epsilon$ ,  $x$  is a proper substring of  $vxy$ . Thus,  $|vy| \geq 1$ .

## Proof of Pumping Lemma (cont'd)

Since both  $r$  and  $s$  have the same label, they are swappable. So, for every  $i \geq 0$ ,  $uv^ixy^iz \in L$ .

## Example 1

$A = \{0^n 1^n 2^n \mid n \geq 0\}$  is not context free.

## Example 1

$A = \{0^n 1^n 2^n \mid n \geq 0\}$  is not context free.

**Proof** Assume, to the contrary, that  $A$  is context free. By Pumping Lemma there exists a constant  $p$  such that every  $w \in A$  of length  $\geq p$  is divided into  $w = uvxyz$  such that  $|vxy| \leq p$ ,  $|vy| \geq 1$ , and for every  $i \geq 0$ ,  $uv^i xy^i z \in A$ .

Let  $w = 0^p 1^p 2^p$ . Since  $|vxy| \leq p$ ,  $vxy$  is either in  $0^* 1^*$  or in  $1^* 2^*$ . This means that  $uv^2 xy^2 z$  cannot have the same number of 0s, 1s, as 2s. ■

## Illustrating Conversation

*Hey, I think I can show  
 $0^n 1^n 2^n$  isn't context  
free.*

## Illustrating Conversation

*Hey, I think I can show  
 $0^n 1^n 2^n$  isn't context  
free.*

*Wow, that's great.  
Tell me about it.*

## Illustrating Conversation

*If that thing is context free, I get this magic constant  $p$ .*

## Illustrating Conversation

## Illustrating Conversation

## Illustrating Conversation

## Illustrating Conversation

*w can be broken down  
into uvxyz, where vy is  
nonempty and vxy has  
length at most p.*

## Illustrating Conversation

*w can be broken down into uvxyz, where vy is nonempty and vxy has length at most p.*

*I see. Then v and y can touch at most two sections.*

## Illustrating Conversation

*Right. So, either  
pumping in or pumping  
out, you can create a  
word that can't be in  
that thing.*

## Illustrating Conversation

## Illustrating Conversation

*By the way, didn't  
you call me "idiot"?*

## Example 2

$B = \{a\#b\#c \mid a, b \text{ and } c \text{ are binary numbers such that } a + b = c\}$   
is not context free.

## Example 2

$B = \{a\#b\#c \mid a, b \text{ and } c \text{ are binary numbers such that } a + b = c\}$   
is not context free.

**Proof** Assume, to the contrary, that  $B$  is context free. Let  $p$  be the constant from Pumping Lemma for  $B$ . Let  $w = 10^p\#10^p\#10^{p+1}$ , where  $a = b = 2^p$  and  $c = 2^{p+1}$ . Let  $uvxyz$  be the decomposition of  $w$  as in the lemma.

## Example 2

$B = \{a\#b\#c \mid a, b \text{ and } c \text{ are binary numbers such that } a + b = c\}$   
is not context free.

**Proof** Assume, to the contrary, that  $B$  is context free. Let  $p$  be the constant from Pumping Lemma for  $B$ . Let  $w = 10^p\#10^p\#10^{p+1}$ , where  $a = b = 2^p$  and  $c = 2^{p+1}$ . Let  $uvxyz$  be the decomposition of  $w$  as in the lemma.

Since each member of  $B$  has exactly two  $\#$ 's, neither  $v$  nor  $y$  contain a  $\#$ . So,  $v$  must be a substring of  $a$ , a substring of  $b$ , or a substring of  $c$ . The same holds for  $y$ .

## Example 2 (cont'd)

Since the equality  $a + b = c$  must be maintained during pumping and  $|vy| \geq 1$ ,  $y$  must be a nonempty substring of  $c$  and  $v$  must be either a nonempty substring of  $a$  or a nonempty substring of  $b$ . However, since  $vxy$  has length at most  $p$ , it must be the case that  $v$  is a nonempty substring of  $b$ .

## Example 2 (cont'd)

Since the equality  $a + b = c$  must be maintained during pumping and  $|vy| \geq 1$ ,  $y$  must be a nonempty substring of  $c$  and  $v$  must be either a nonempty substring of  $a$  or a nonempty substring of  $b$ . However, since  $vxy$  has length at most  $p$ , it must be the case that  $v$  is a nonempty substring of  $b$ .

If  $v$  contains the first letter of  $b$ , then  $vxy$  must be a part of  $b$ , so  $v$  should consist solely of 0's.

## Example 2 (cont'd)

Since the equality  $a + b = c$  must be maintained during pumping and  $|vy| \geq 1$ ,  $y$  must be a nonempty substring of  $c$  and  $v$  must be either a nonempty substring of  $a$  or a nonempty substring of  $b$ . However, since  $vxy$  has length at most  $p$ , it must be the case that  $v$  is a nonempty substring of  $b$ .

If  $v$  contains the first letter of  $b$ , then  $vxy$  must be a part of  $b$ , so  $v$  should consist solely of 0's.

Suppose  $y$  contains 1, the first letter of  $c$ . Then  $uvz$  is the form  $10^p \# 10^q \# 0^r$ , which clearly is not a member of  $B$ .

## Example 2 (cont'd)

Since the equality  $a + b = c$  must be maintained during pumping and  $|vy| \geq 1$ ,  $y$  must be a nonempty substring of  $c$  and  $v$  must be either a nonempty substring of  $a$  or a nonempty substring of  $b$ . However, since  $vxy$  has length at most  $p$ , it must be the case that  $v$  is a nonempty substring of  $b$ .

If  $v$  contains the first letter of  $b$ , then  $vxy$  must be a part of  $b$ , so  $v$  should consist solely of 0's.

Suppose  $y$  contains 1, the first letter of  $c$ . Then  $uvz$  is the form  $10^p \# 10^q \# 0^r$ , which clearly is not a member of  $B$ .

Suppose  $y$  does not contain the letter 1. Then  $y$  consists solely of 0s. Then  $uvvxyyz$  is of the form  $10^p \# 10^q \# 10^r$  such that  $q, r > p$ , which clearly isn't a member of  $B$ . ■

### Example 3

$C = \{ww \mid w \in \{0, 1\}^*\}$  is not context free.

### Example 3

$C = \{ww \mid w \in \{0, 1\}^*\}$  is not context free.

**Proof** Assume  $C$  is context free. Let  $p$  the constant from the pumping lemma for  $C$ .

Let  $w = 0^p 1^p 0^p 1^p$ . Then  $w$  in  $C$ .

### Example 3

$C = \{ww \mid w \in \{0, 1\}^*\}$  is not context free.

**Proof** Assume  $C$  is context free. Let  $p$  the constant from the pumping lemma for  $C$ .

Let  $w = 0^p 1^p 0^p 1^p$ . Then  $w$  in  $C$ .

Let  $w = uvxyz$  be the decomposition of  $w$  such that  $|vy| > 0$ ,  $|vxy| \leq p$ , and for every  $i \geq 0$ ,  $uv^i xy^i z \in C$ .

### Example 3

$C = \{ww \mid w \in \{0, 1\}^*\}$  is not context free.

**Proof** Assume  $C$  is context free. Let  $p$  the constant from the pumping lemma for  $C$ .

Let  $w = 0^p 1^p 0^p 1^p$ . Then  $w$  in  $C$ .

Let  $w = uvxyz$  be the decomposition of  $w$  such that  $|vy| > 0$ ,  $|vxy| \leq p$ , and for every  $i \geq 0$ ,  $uv^i xy^i z \in C$ .

If  $v$  contains a symbol from the first  $0^p$  then  $y$  cannot contain one from the second  $0^p$ , so pumping doesn't work.

### Example 3

$C = \{ww \mid w \in \{0, 1\}^*\}$  is not context free.

**Proof** Assume  $C$  is context free. Let  $p$  the constant from the pumping lemma for  $C$ .

Let  $w = 0^p 1^p 0^p 1^p$ . Then  $w$  in  $C$ .

Let  $w = uvxyz$  be the decomposition of  $w$  such that  $|vy| > 0$ ,  $|vxy| \leq p$ , and for every  $i \geq 0$ ,  $uv^i xy^i z \in C$ .

If  $v$  contains a symbol from the first  $0^p$  then  $y$  cannot contain one from the second  $0^p$ , so pumping doesn't work.

If  $v$  contains only symbols from the first  $1^p$  then  $y$  cannot contain one from the second  $1^p$ , so pumping doesn't work.

### Example 3

$C = \{ww \mid w \in \{0, 1\}^*\}$  is not context free.

**Proof** Assume  $C$  is context free. Let  $p$  the constant from the pumping lemma for  $C$ .

Let  $w = 0^p 1^p 0^p 1^p$ . Then  $w$  in  $C$ .

Let  $w = uvxyz$  be the decomposition of  $w$  such that  $|vy| > 0$ ,  $|vxy| \leq p$ , and for every  $i \geq 0$ ,  $uv^i xy^i z \in C$ .

If  $v$  contains a symbol from the first  $0^p$  then  $y$  cannot contain one from the second  $0^p$ , so pumping doesn't work.

If  $v$  contains only symbols from the first  $1^p$  then  $y$  cannot contain one from the second  $1^p$ , so pumping doesn't work.

If  $v$  contains only symbols from the second  $0^p 1^p$  then pumping does not work. ■

## Application

**Corollary.** The class of context-free languages is not closed under intersection.

**Proof** Let  $L_1 = \{0^i 1^j 2^k \mid i = j\}$  and  $L_2 = \{0^i 1^j 2^k \mid j = k\}$ . Then  $L_1$  and  $L_2$  are both context free. If the class were closed under intersection then  $L_1 \cap L_2 = \{0^n 1^n 2^n \mid n \geq 0\}$  would be context free. ■

**Corollary.** The class of context-free languages is not closed under complement.

**Proof** We know that the class is closed under union. If the class were closed under complement, then by DeMorgan's Law, it would be closed under intersection. ■
